

## Handrail Guard™ Installation Guide

1. Locate the Handrail Guards on your railing.  
Make sure that you install the Handrail Guard far enough down from the top of the railing so that the skater can't jump over the Handrail Guard. Typically, the Handrail Guard should be installed 1/3 to 2/3 of the way down the railing.
2. Mark the location for the bolt holes and drill pilot holes.
3. Tap into the railing.
4. Set the Handrail Guard on the railing and make sure that it sets flush to the railing. This may require the use of a rubber mallet or a padded C-clamp.
5. Install the bolt or bolts, applying high-strength thread locks to the threads.
